Motivation : Adapter-based Continual Learning

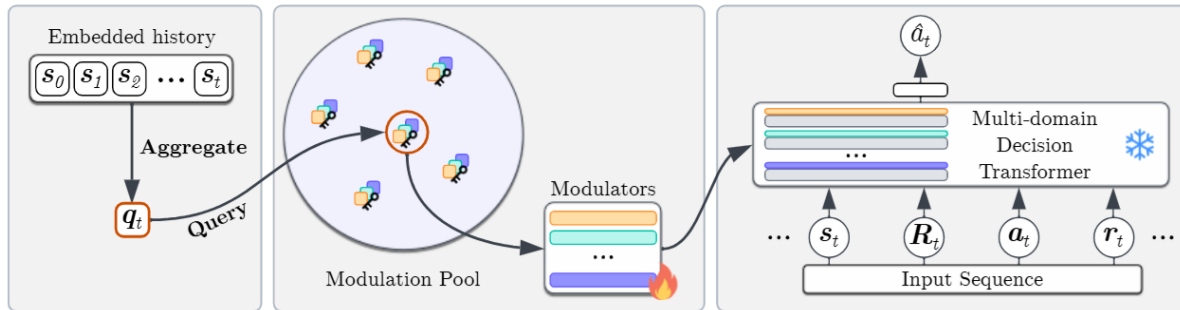

Schmied, Thomas, et al. "Learning to Modulate pre-trained Models in RL." (NeurIPS 2023)

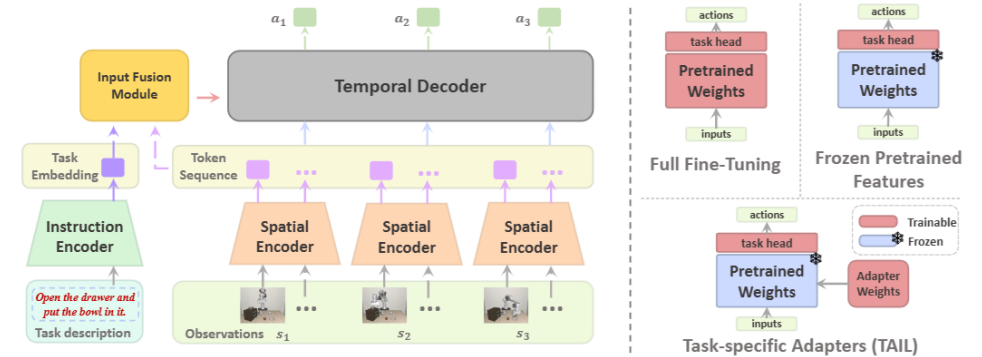

Liu, Zuxin, et al. "Tail: Task-specific adapters for imitation learning with large pretrained models." (ICLR 2024)

Motivation : Adapter-based Continual Learning

Schmied, Thomas, et al. "Learning to Modulate pre-trained Models in RL." (NeurIPS 2023)

Liu, Zuxin, et al. "Tail: Task-specific adapters for imitation learning with large pretrained models." (ICLR 2024)

- When and how can we achieve positive backward transfer, similar to humans?
- How can these tasks be managed flexibly in dynamic environments?

Challenges in Continual Imitation Learning

1. Requirement for comprehensive expert demonstration

- Inefficient, especially for long-horizon tasks.
- Sometimes impossible to collect expert demonstrations.

2. Frequent task shifts in non-stationary environments

- The continual shifting of tasks in non-stationary environments
- Difficulty in adapting to unseen tasks

3. Actual privacy concerns

- Accumulating knowledge in model parameters can raise privacy issues.
- Sensitive information may be implicitly retained.

IsCiL : Incremental skills for Continual imitation Learning

How to solve? : Retrievable skills

1. **Prototype-based skill incremental learning** [training]
2. **Task-wise selective adaptation** [evaluation]

FWT: Assesses learning of new tasks using prior knowledge.

BWT: Measures impact of new learning on past tasks.

AUC: Indicates average performance across all stages.

- IsCiL efficiently improves AUC performance
- IsCiL shows positive backward transfer

Results : Unseen task adaptation
