

# Conditional Density Estimation with Histogram Trees

*Welcome to our poster **at poster session 1**: Wed 11 Dec 11 a.m. PST – 2 p.m. PST*  
**NeurIPS 2024**

*Lincen Yang (presenting the slides) & Matthijs van Leeuwen*  
**Leiden University, The Netherlands**

# Why conditional density estimation (CDE)?

- Get the full conditional distribution  $P(Y|X)$ , which provides more information than regression  $E(Y|X)$ .

Figure from: Takeuchi, Ichiro, Kaname Nomura, and Takafumi Kanamori.  
"Nonparametric conditional density estimation using piecewise-linear solution path of kernel quantile regression."  
*Neural Computation* 21.2 (2009): 533-559.

# Why conditional density estimation (CDE)?

- Get the full conditional distribution  $P(Y|X)$ , which provides more information than regression  $E(Y|X)$ .
- Useful for **uncertainty quantification** and **knowledge discovery**.

Figure from: Takeuchi, Ichiro, Kaname Nomura, and Takafumi Kanamori.  
"Nonparametric conditional density estimation using piecewise-linear solution path of kernel quantile regression."  
*Neural Computation* 21.2 (2009): 533-559.

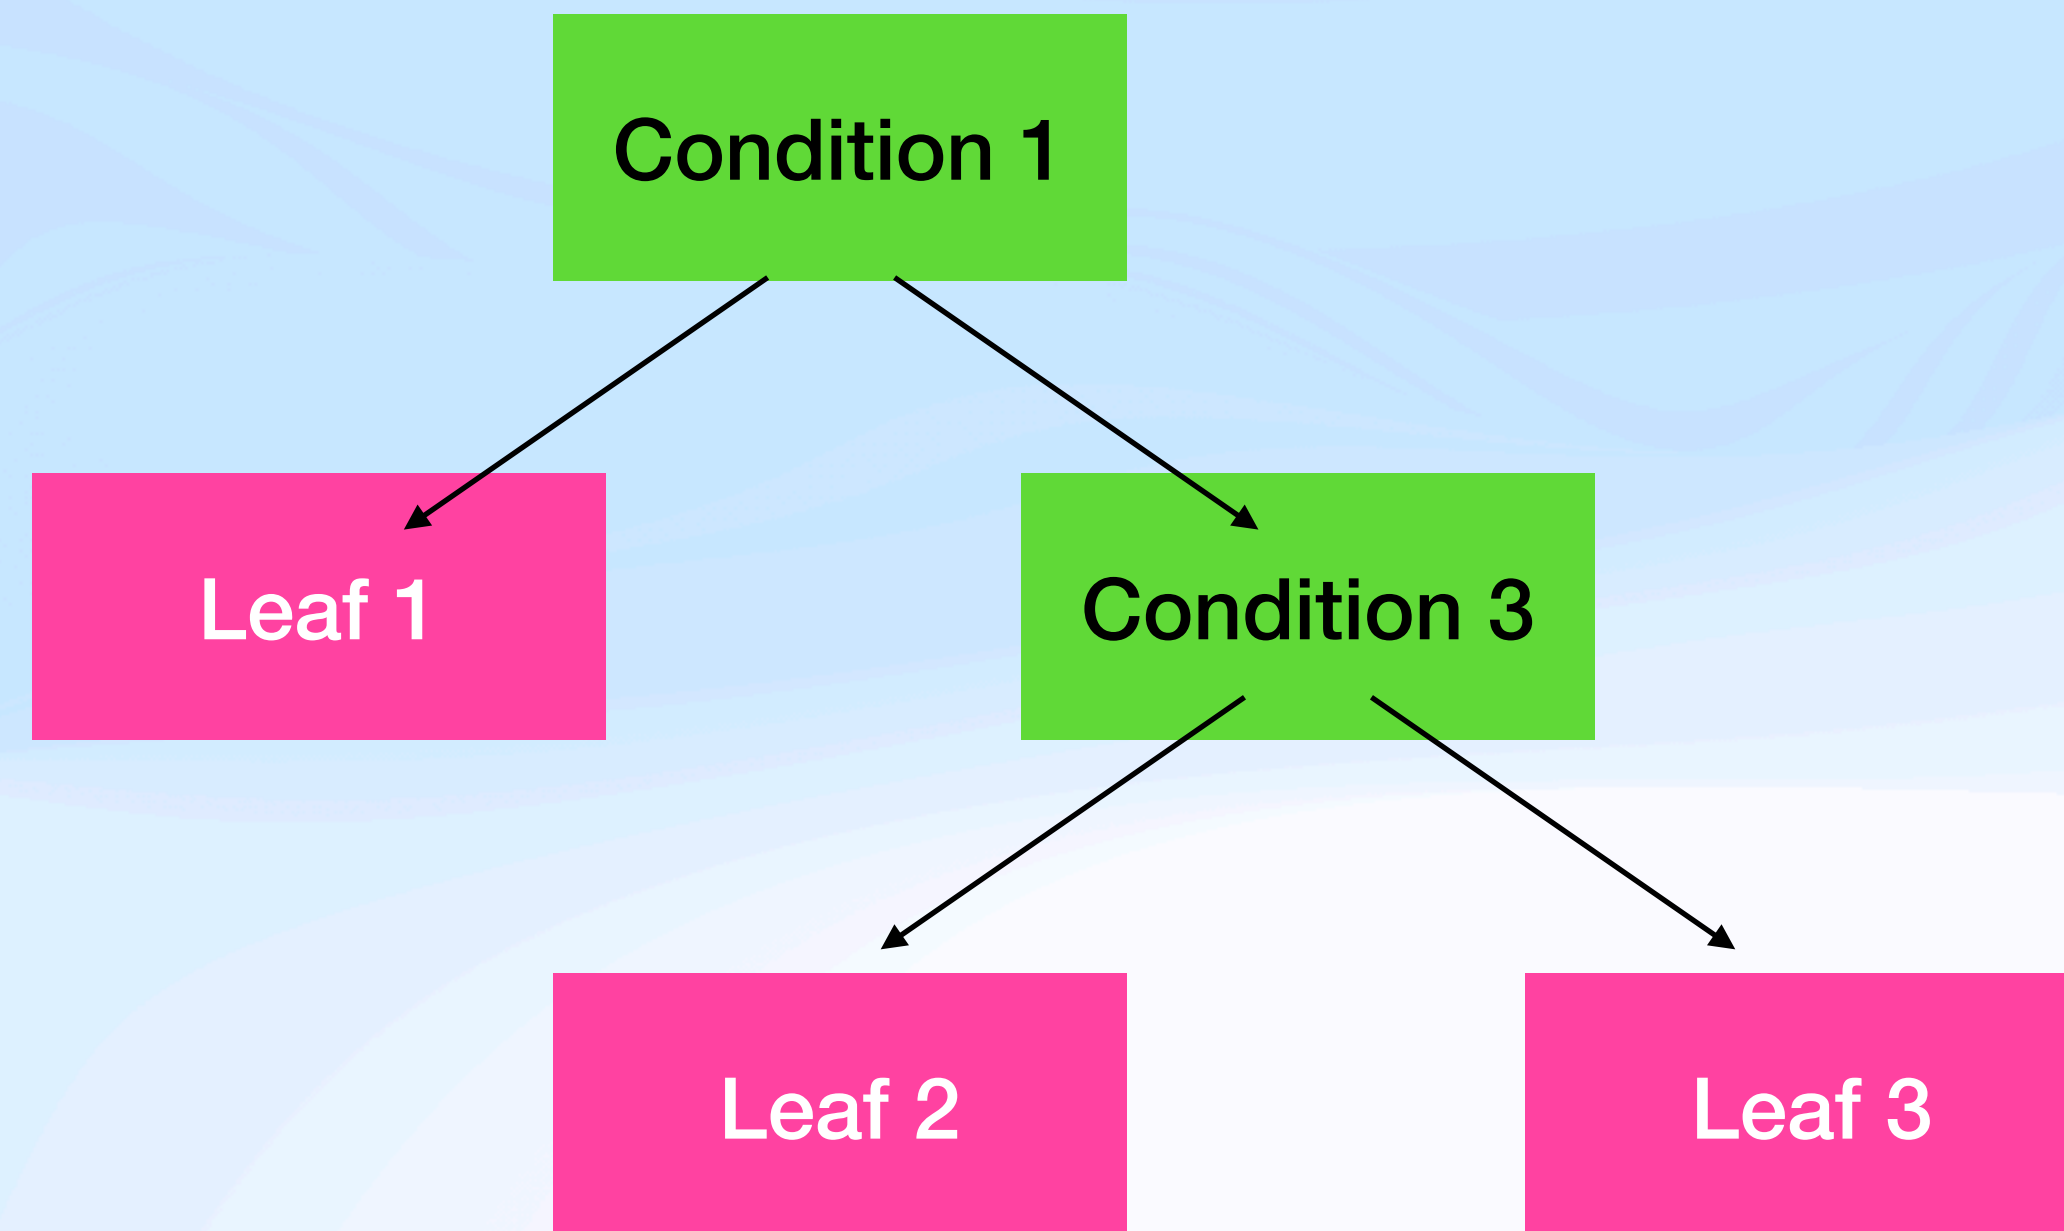

# Research Gap

- Existing Methods for CDE
  - Kernel-based methods (the standard “shallow” methods for now)
  - Black-box methods (Normalizing Flows, Boosted trees, etc)

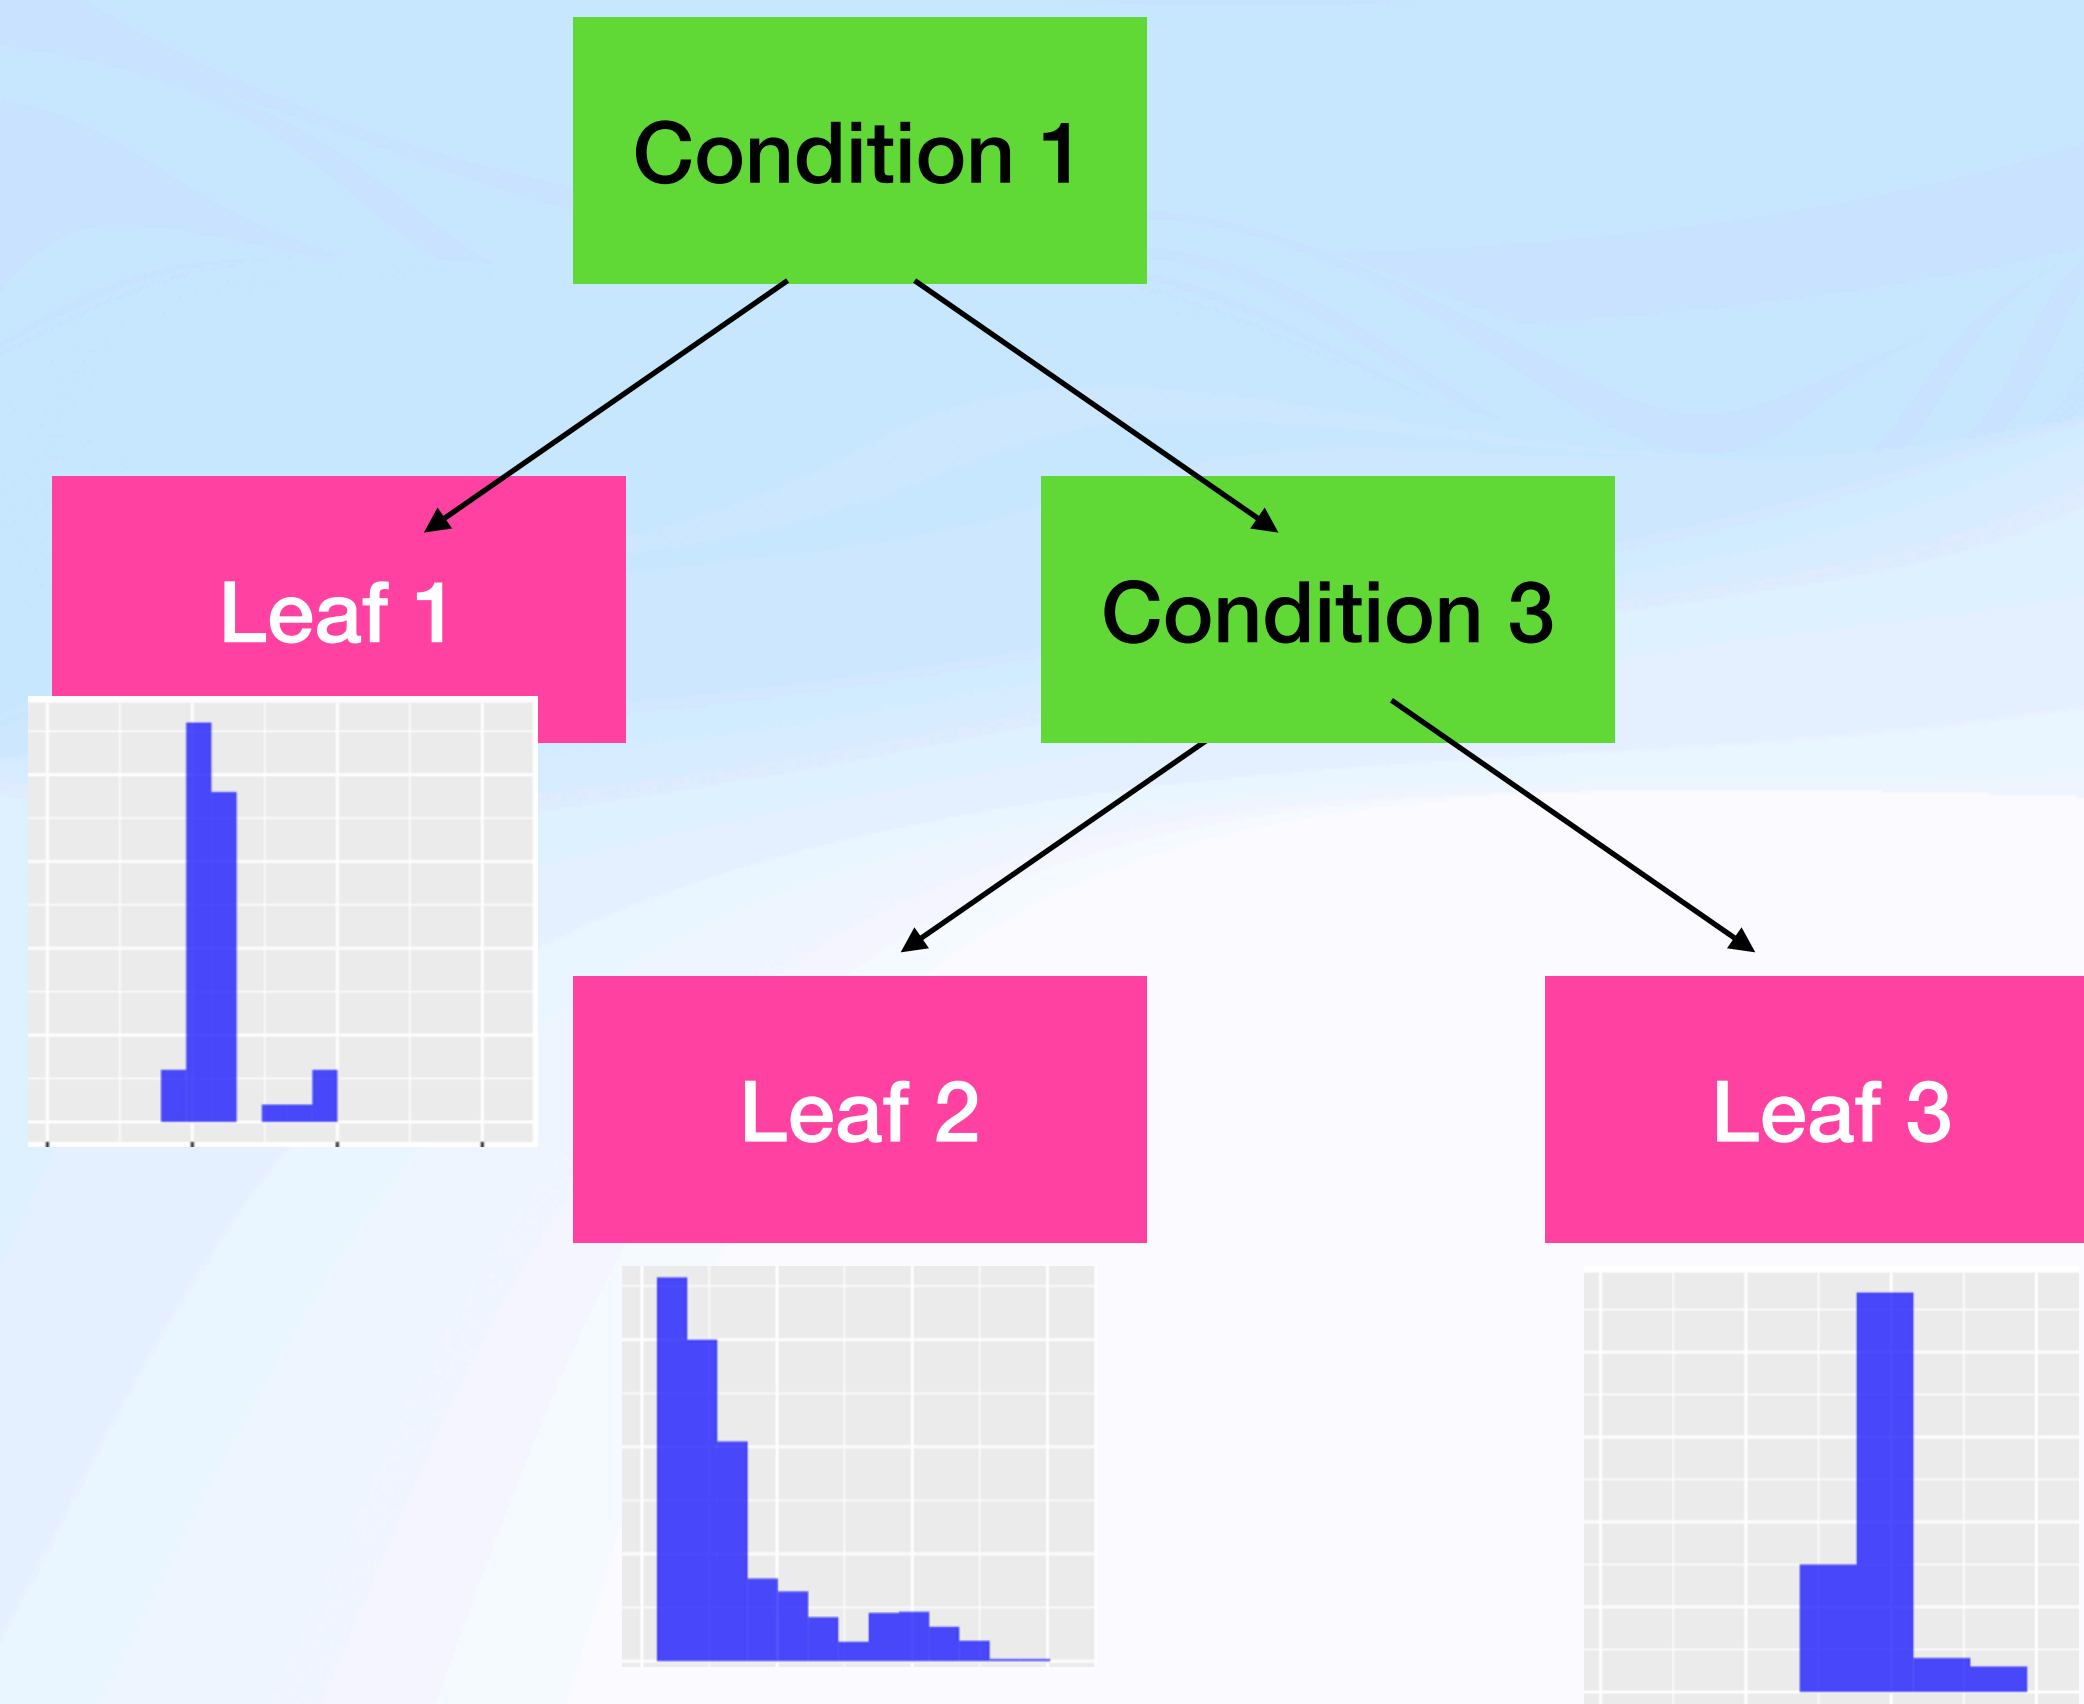

# Research Gap

- Existing Methods for CDE
  - Kernel-based methods (the standard “shallow” methods for now)
  - Black-box methods (Normalizing Flows, Boosted trees, etc)
- **Intrinsically Interpretable models like decision trees have been understudied for conditional density estimation (CDE)!**
  - Arguably more interpretable than kernel-based methods

# CDTree: Conditional Density Estimation Tree

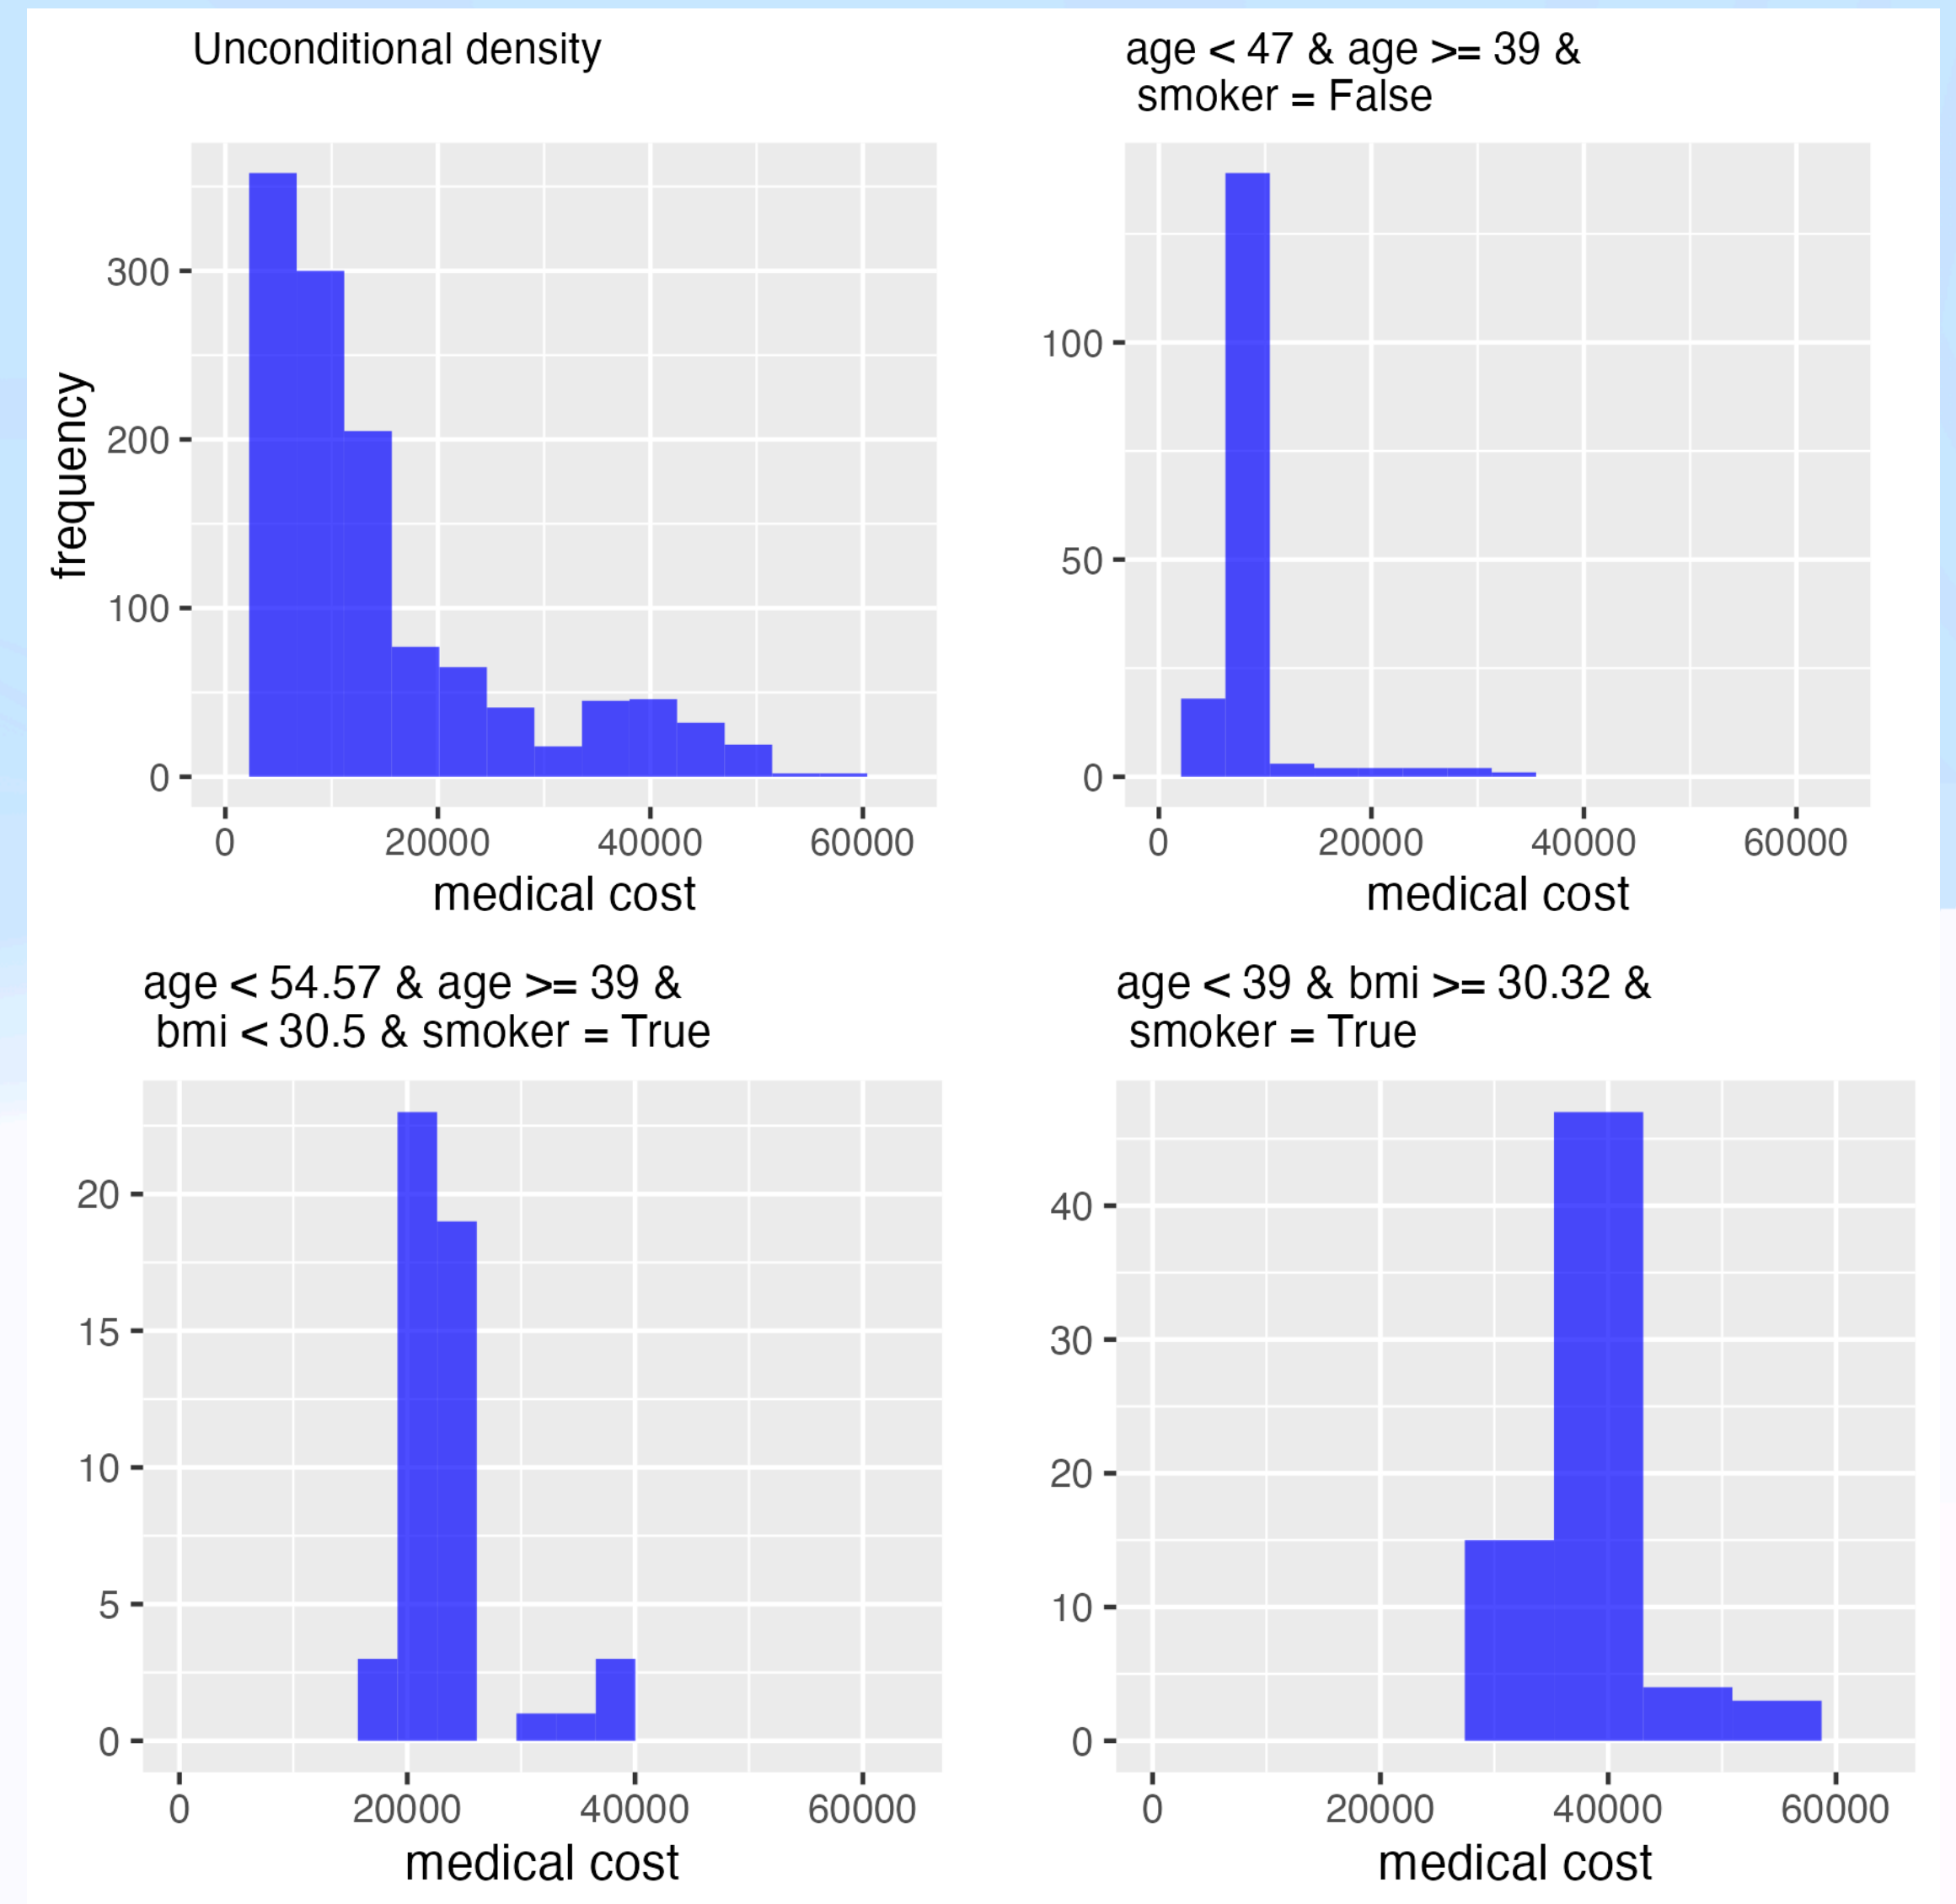

# CDTree: Conditional Density Estimation Tree

# CDTree: Conditional Density Estimation Tree

- Modeling the associations between medical costs and demographic & life style feature variables (e.g., smoker or not).

# Learning CDTree, key features:

- Adopting the minimum description length (MDL) principle

$$M^* = \arg \min_{M \in \mathcal{M}} L(D | M) + L(M)$$

# Learning CDTree, key features:

- Adopting the minimum description length (MDL) principle

$$M^* = \arg \min_{M \in \mathcal{M}} L(D | M) + L(M)$$

- $L(D | M)$ : code length in bits needed to encode the data given model  $M$

# Learning CDTree, key features:

- Adopting the minimum description length (MDL) principle

$$M^* = \arg \min_{M \in \mathcal{M}} L(D | M) + L(M)$$

- $L(D | M)$ : code length in bits needed to encode the data given model  $M$
- $L(M)$ : code length in bits needed to encode the model itself.

# Learning CDTree, key features:

- Adopting the minimum description length (MDL) principle

$$M^* = \arg \min_{M \in \mathcal{M}} L(D | M) + L(M)$$

- $L(D | M)$ : code length in bits needed to encode the data given model  $M$
- $L(M)$ : code length in bits needed to encode the model itself.
- In contrast, traditional optimization score often involves

$$M^* = \arg \min_{M \in \mathcal{M}} \text{Loss function (likelihood of data)} + \alpha \text{ Tree Size}$$

# Learning CDTree, key features:

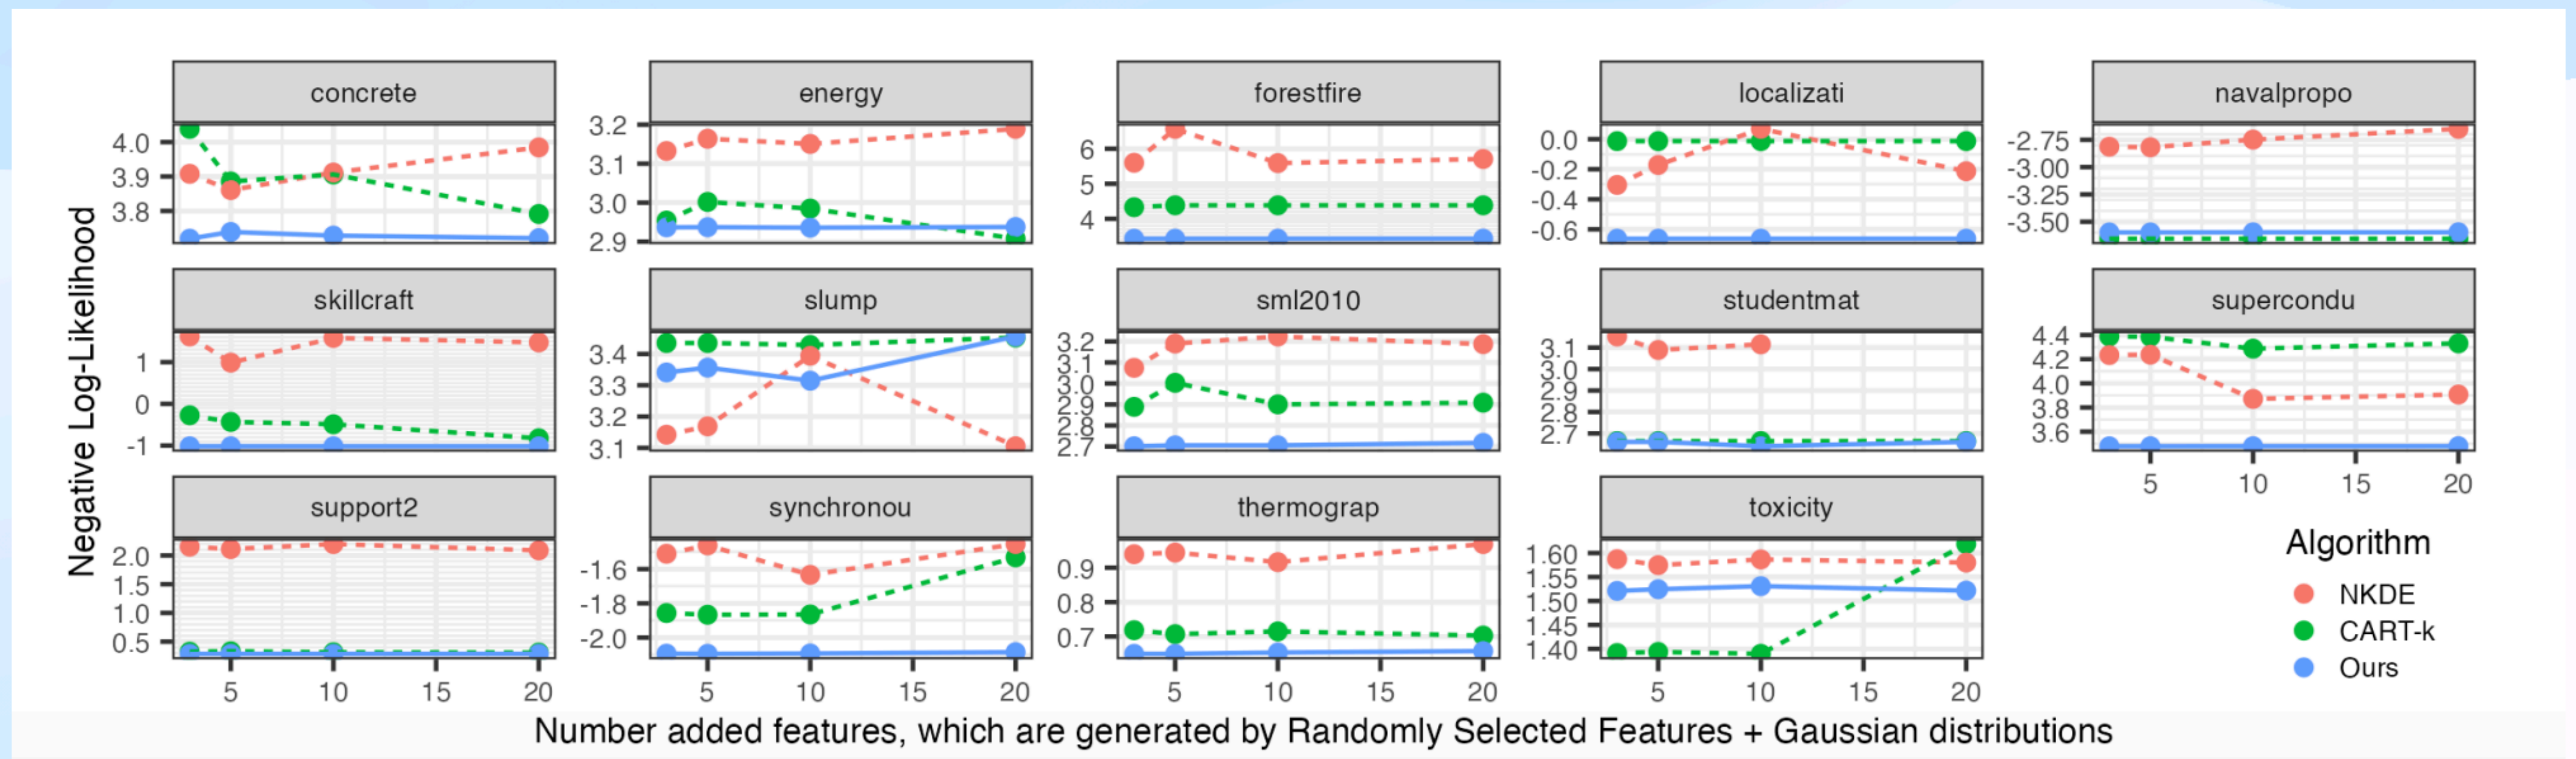

- No cross-validation for the hyper-parameter  $\alpha$  to control overfitting
- Advantages:
  - Reduce runtime
  - Make the learned CDTree stable, *favoring interpretability*

# Learning CDTree, key features:

- Iteratively grow the tree, **WITHOUT pruning**

# Learning CDTree, key features:

- Iteratively grow the tree, **WITHOUT pruning**
- Advantages: Speed up the training & **Robust to "irrelevant" features**

# Experiment Results

# Predictive performance

Table 2: Negative log-likelihoods (smaller is better) on test sets. The best results among interpretable methods are shown in **bold**, and the best results among all interpretable and black-box models are marked by the underlines. The datasets are ordered by their numbers of columns (ascending).

# Model complexity: tree sizes

# Conclusions

- We developed **CDTree**, the first dedicated decision tree method for non-parametric conditional density estimation.

# Conclusions

- We developed **CDTree**, the first dedicated decision tree method for non-parametric conditional density estimation.
- We have demonstrated its competitive predictive performance and interpretability.

# Conclusions
